

BODY PLUS 25

Smoothing
Invigorating
Bio-Stimulating

Segment

HOME CARE: Smoothing, toning, bio-stimulating body lotion.
Code CD 02 , Vol. Tube 150 ml.

Product structure

Lightweight body lotion, easily absorbed, parabens free and fragrance free.

Product characteristics

BODY PLUS 25: Body lotion is rich in modern active ingredients, suitable for daily treatment of hypotonic and thickened skin. Its formulation contains selected substances with high and specific biochemical activity, able to interact with each other in a complete way to treat different aspects of skin imperfections. Several AHAs fit both free and has slow release were associated with a new and unique peptide able to promote strong biostimulation of fibroblasts. The synergy of these substances will facilitate the rebalancing of cell turnover and regeneration of components of the DEJ and the dermis as well as . Real biological revitalization and a complete structural rejuvenation.

Benefit

- Significantly improves smoothness.
- Stimulates cell turnover.
- Stimulates fibroblasts.
- Increases production of collagens, elastine and GAGs.
- Promotes restructuring of the DEJ and the ECM.
- Improves elasticity and skin tone density.
- Makes the skin silky to the touch

Active substances

GLYCOLIC ACID: Organic acid naturally occurring especially in sugar cane. It differs from other AHAs because it contains only two carbon atoms. It is not light-sensitive and has many properties useful to the skin: reduces the thickening of the horny layer by acting on the links between the corneocytes, increases the inner thickness of the epidermis, reactivates cellular metabolism, contributes to the renewal and restructuring of the dermis. It facilitates the penetration of other active ingredients into the skin, has a direct and indirect positive effect on many biochemical processes of the skin, helps to maintain a uniform skin color.

PHA Gluconolactone: The PHAs block the Radicals Oxygen preventing structural and functional damage in the skin and protecting it from external aggression. This substance with multiple properties is able to act on the bond strength of corneodesmosomes preserving and restoring proper cell renewal of the corneocytes of the SC. Naturally found in the skin as an important active ingredient in the processes of cell renewal. In fact keratinocytes synthesize and naturally convert gluconic acid and gluconolactone in Ribose and Deoxyribose, which are found in RNA and DNA respectively. It has a strong moisturizing capacity, it modulates the process keratinization, revitalizes cell turnover, and is a natural antioxidant against RL, improves barrier function especially in sensitive skin, improves skin texture and protects from photo-aging.

MALIC ACID: A catalyst of the Krebs' cycle which, stimulates the complete combustion of fuel to produce energy. skin aging among the various functional alterations there is a deficient activity of the Krebs cycle, so less energy Organic . The enzymes which are bound by various endotoxins can influence the chemistry of the Krebs' cycle, reducing the ability of pyruvic acid to enter the energy production cycle. Also shows : cell turnover re-modulating, antioxidant and moisturizing properties.

DERMAXYL: It improves the integrity of the skin and the skin barrier. It decreases TEWL, improves elastin synthesis. It has chemotactic action.

ASCORBYL PALMITATE: The ascorbyl palmitate is an antioxidant that comes from the reaction between ascorbic acid (vitamin C) and palmitic acid (a fatty acid). Vitamin C is unstable and is one of 'heat-labile compounds. Vitamin C, as for its structural features, is water soluble and has no affinity with the environment that contains lipids or fats. Changes in the ascorbic acid and ascorbyl palmitate have therefore an important goal: to convert ascorbic acid into a molecule that may come in contact with matrices in which fats are present. The molecule is also more stable than the free ascorbic acid. It strengthens the immune system and supports the body's defense mechanisms, it also favors cell renewal processes and, serves as an important co-factor for collagen production. It has antioxidant (ROS) and anti-inflammatory activity, preserves the integrity of capillaries, facilitates the healing process.

MANDELIC ACID: Modulator of skin cell functions, has sanitizing, moisturizing and, firming properties, evens out the complexion, gives your skin an instant glow and enhances proliferation and differentiation of keratinocytes.

Instructions for use

Apply this lotion 1-2 times a day all over the body, massaging gently until completely absorbed.
