

INTERACTIVE CREAM

Total Antioxidant
Reinforcing
Cell Protector

Segment

HOME SKIN CARE: Reparative Anti-aging cream, Reparative, Multifunctional Metabolic Activator
Code D30 – Vol. Airless 50 ml

Product structure

Paraben-free fine cream

Product characteristics

INTERACTIVE CREAM: Rich cream with growth factors exhibiting strong dermatological activity. It is able to stimulate a profound and complete renovation and regeneration of the epidermis, the dermis and the DEJ (Dermal-Epidermal Junction). Strong and specific bio-stimulation of fibroblasts is accompanied by action to regularize the micro-inflammation and degeneration of the main catabolic mechanisms such as MMPs and glycation, which are structurally extended and long lasting.

Benefits

- Regeneration of the DEJ
- Regeneration of the ECM
- Optimization of the physiological state of the skin
- Optimization of epidermal regeneration with enhanced bio-functionality of stem cells
- Counteracts glycation and regulates MMPs.
- Optimizes the mechanisms of cutaneous repair

Active substances

SURVIXYL Pentapeptide-31: A next-generation peptide that is a result of the latest discoveries in the field of stem cell research and is specifically designed to address five major factors that regulate the biological activity of the stem cells of the skin. It helps strengthen and preserve the microenvironment of stem cells and optimize epidermal rejuvenation.

G-FACTOR P63 - exclusively Natinuel: Activates differentiation of stem cells, promotes angiogenesis, increases biosynthesis of collagen, elastin, proteoglycans and GAGs, stimulates the skin's self-repair mechanisms that reconstruct the skin's protective barrier. Counteracts glycation of activated protein antioxidants such as SOD. Inhibits MMPs, blocks the activity of interleukin-1.

aFGF (ACIDIC FIBROBLAST GROWTH FACTOR): fibroblast growth factors are key players in the processes of cell proliferation and differentiation. aFGF interacts with FGFR-2 activating rejuvenation of fibroblasts resulting in better production of collagen and elastin, hyaluronic acid with a general increase in dermal density. This activates regeneration of tissue damaged as a result of chrono and photo-aging.

bFGF (BASIC FIBROBLAST GROWTH FACTOR): Activates biological mechanisms responsible for regeneration and re-organization of the dermal extracellular matrix. Stimulates proliferation of fibroblasts, stimulates neocollagenogenesis and synthesis of new elastic fibers, stimulates production of glycosaminoglycans, increases fibronectin synthesis.

IDEBENON: Has a double action: blocks and eliminates free radicals generated by the environment, neutralizes free radicals generated internally, improves oxygenation and cellular energy.

HYACARE FILLER CL (Cross-linked Hyaluronic Acid): Has superior water-binding properties comparable to that of a super-absorbing polymer, has a high stability and resistance to enzymatic degradation. Micro-particles accumulate in puckering of the skin and wrinkles, creating a real filling effect.
