

INTERACTIVE PLUS

Anti-Aging
Metabolic Activator
Regenerator

Segment

PROFESSIONAL SKIN CARE: Metabolic activator, anti-aging properties.
Code PS00, Vol. Flacon 50 ml.

Product structure

Compact milky serum free of parabens and fragrance.

Product characteristics

INTERACTIVE PLUS: Unique bio-functional complex product whose original formula radically changes the way of treating the aging skin, in particular problems connected with photo-aging. Interactive plus demonstrates strong multidirectional dermatological activity in anti-aging treatment. Its use allows us to reactivate simultaneously energetic, generative, protective and reparative biological processes affecting the Epidermis, Dermis and DEJ (Dermo-Epidermal Junction), for a total renovation and rejuvenation of the skin.

Benefits

Increases collagen synthesis, activates fibroblasts, interact with specific receptors, has anti-oxidant, and anti-glycation properties and inhibits 2-9 MMPs. It has depigmentation, cellular bio-protection and anti-aging properties. It influences different anabolic and catabolic processes, activating strong DEJ and ECM (Extra-Cellular-Matrix) restructuring and epidermal regeneration for a total skin renewal.

Active substances

BIOMIMETIC TRIPEPTIDE: It causes controlled weakening of the connections between cells. It recreates the natural desquamation process which usually occurs in young skin.

POLYHYDROXYACID: Present in the skin, it is important in cell renewal processes, demonstrates strong moisturizing properties, modulates the process of keratinization, revitalizes cell turnover. It is also an antioxidant against ROS, improves the skin barrier function, especially in sensitive skin, protects your skin against photo-aging.

AHAs (Cycle-system): They activate the mechanisms that regulate cellular energy metabolism at the dermal-epidermal level (energizing)

MALIC ACID: Acts as a catalyst in the Krebs cycle, stimulates complete burning of energy rich substances.

RETINAL: Retinal is converted into retinoic acid and puts in place a real cellular reprogramming through actions of gene repression and derepression.

G-FACTOR P63 - exclusively Natinel: Activates differentiation of stem cells, promotes angiogenesis, increases biosynthesis of collagen, elastin, proteoglycans and GAGs, stimulates the skin repair mechanisms rebuilding the protective skin barrier, prevents glycation of proteins, activates removal of damaged skin proteins, activates antioxidant protein called SOD and MMPs inhibition, blocks the activity of interleukin-1.

IDEBENON: Is a dual action product, it blocks and removes free radicals generated by the environment, neutralizes free radicals generated internally, improves oxygenation and cellular energy.

DMAE: Improves skin firmness and muscle tone, increases the synthesis of collagen and elastin, it also has antioxidant properties.
